# Good talks and promising contacts

**Labelexpo 2019 turns out to be a great success for UV specialist Hönle.**

The visitors were especially interested in Hönle's latest development. [UVAPRINT varyCURE](#) is a highly intensive hybrid curing system based on a cassette technology with interchangeable UV lamp and UV-LED inserts which are supplied and controlled by only one system: [EPSA varyPOWER](#) instantly recognises the inserted technology, an intelligent control adjusts all system-relevant settings automatically. UVAPRINT varyCure is available with air or water-cooling.

»We have also noticed an increased demand for [inert UV systems](#), « reports Dieter Stirner, Sales Director at Hönle. »We have a wealth of experience within this field and have equipped many coating machines worldwide. « Inert UV systems are often applied for curing release silicone coatings on liners and for other applications, even with temperature-sensitive substrates. They are also used for packaging applications where low migration and smell reduction is an issue. »We are very pleased with the new inputs and contacts we got at Labelexpo and look forward to interesting projects which might arise from them. «
